CQB75W Series
Application Note V12 February 2020

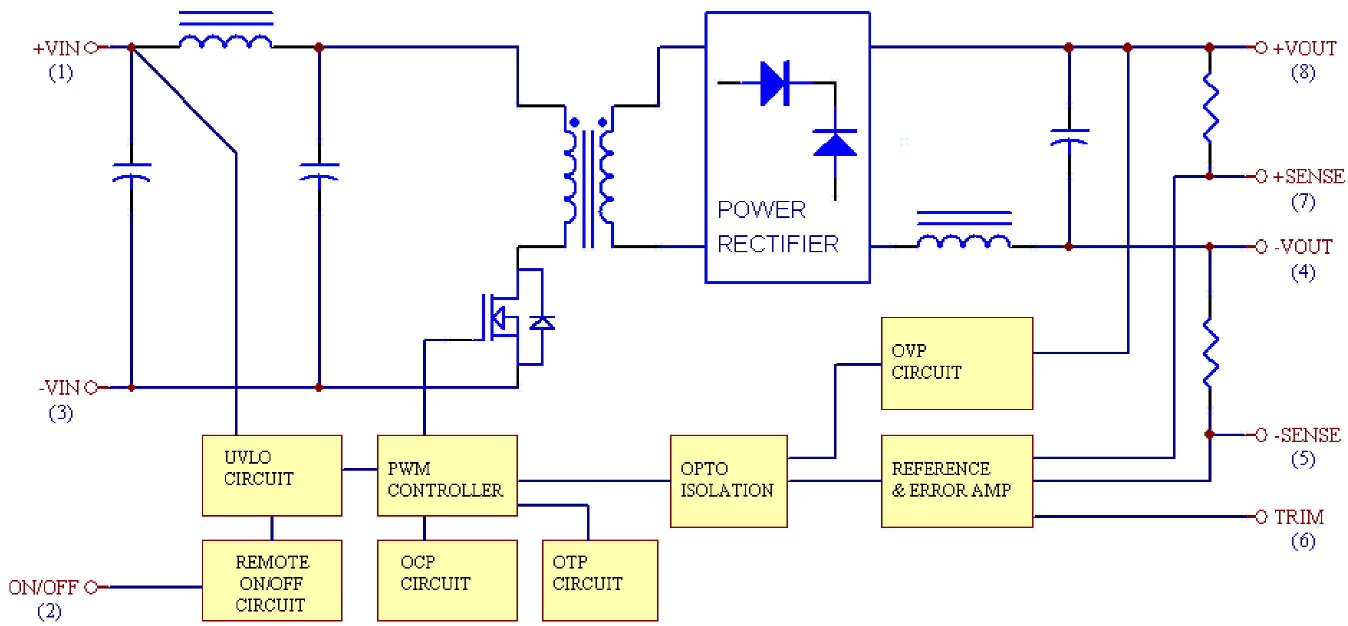
1. Introduction

This specification describes the features and functions of Cincon's CQB75W series of isolated DC-DC Converters. These are highly efficient, reliable and compact, high power density, single output DC/DC converters. The modules can be used in the field of telecommunications, data communications, wireless communications, servers etc. The CQB75W series can deliver up to 12A output current and provide a precisely regulated output voltage over a wide range of input voltages (Vi = 9- 36 or 18- 75Vdc). The modules can achieve high efficiency up to 87%. The module offers direct cooling of dissipative components for excellent thermal performance. Standard features include remote On/Off, remote sense, output voltage adjustment, over voltage, over current and over temperature protection. The CQB75W series also have the following options: remote On/Off (positive or negative).

2. DC-DC Converter Features

- 39.6-75W Isolated Output
- Efficiency to 87%
- Fixed Switching Frequency
- Regulated Output
- Continuous Short Circuit Protection
- Industry Standard Quarter-Brick Package
- UL60950-1 2nd Approval

3. Electrical Block Diagram



Electrical Block Diagram for other modules

4. Technical Specifications

(All specifications are typical at nominal input, full load at 25°C unless otherwise noted.)

ABSOLUTE MAXIMUM RATINGS

PARAMETER	NOTES and CONDITIONS	Device	Min.	Typical	Max.	Units
Input Voltage						
Continuous		24SXX 48SXX	-0.3 -0.3		36 75	V_{dc}
Transient	100ms	24SXX 48SXX			50 100	V_{dc}
Operating Case Temperature		All	-40		100	°C
Storage Temperature		All	-55		105	°C
Isolation Voltage	1 minute; input/output, input/case, output/case	All	1500			V_{dc}

INPUT CHARACTERISTICS

PARAMETER	NOTES and CONDITIONS	Device	Min.	Typical	Max.	Units
Operating Input Voltage		24SXX 48SXX	9 18	24 48	36 75	V_{dc}

Weight		All		63		grams

5. Main Features and Functions

5.1 Operating Temperature Range

The CQB75W series converters can be operated within a wide case temperature range of -40°C to 100°C. Consideration must be given to the derating curves when ascertaining maximum power that can be drawn from the converter. The maximum power drawn from quarter brick models is influenced by usual factors, such as:

- Input voltage range
- Output load current
- Forced air or natural convection

5.2 Output Voltage Adjustment

Section 6.8 describes in detail how to trim the output voltage with respect to its set point. The output voltage on all models is adjustable within the range of +10% to –10%.

5.3 Over Current Protection

The converter is protected against over current or short circuit conditions. At the instance of current-limit inception, the module enters a hiccup mode of operation, whereby it shuts down and automatically attempts to restart. While the fault condition exists, the module will remain in this hiccup mode, and can remain in this mode until the fault is cleared. The unit operates normally once the output current is reduced back into its specified range.

5.4 Output Overvoltage Protection

The output overvoltage protection consists of circuitry that internally limits the output voltage. If more accurate output over voltage protection is required then an external circuit can be used via the remote on/off pin.

5.6 Remote On/Off

The CQB75W series allows the user to switch the module on and off electronically with the remote on/off feature. All models are available in “positive logic” and “negative logic” (optional) versions. The converter turns on if the remote on/off pin is high (>3.5Vdc or open circuit). Setting the pin low (0 to <1.8Vdc) will turn the converter off. The signal level of the remote on/off input is defined with respect to ground. If not using the remote on/off pin, leave the pin open (converter will be on). Models with part number suffix “N” are the “negative logic” remote on/off version. The unit turns off if the remote on/off pin is high (>3.5Vdc or open circuit). The converter turns on if the on/off pin input is low (0 to <1.8Vdc). Note that the converter is off by default.

5.7 UVLO (Under Voltage Lock Out)

Input under voltage lockout is standard on the CQB75W unit. The unit will shut down when the input voltage drops below a threshold, and the unit will operate when the input voltage goes above the upper threshold.

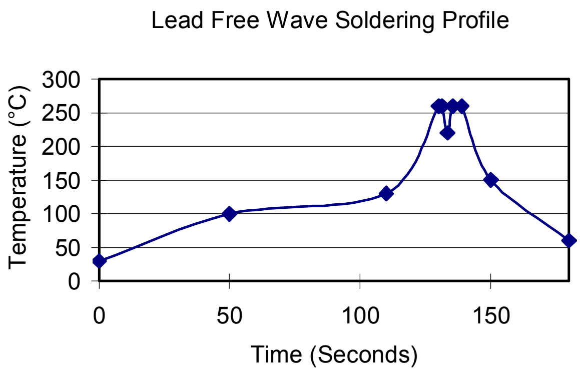
5.8 Over Temperature Protection

These modules have an over temperature protection circuit to safeguard against thermal damage. Shutdown occurs with the maximum case reference temperature is exceeded. The module will restart when the case temperature falls below over temperature shutdown threshold.

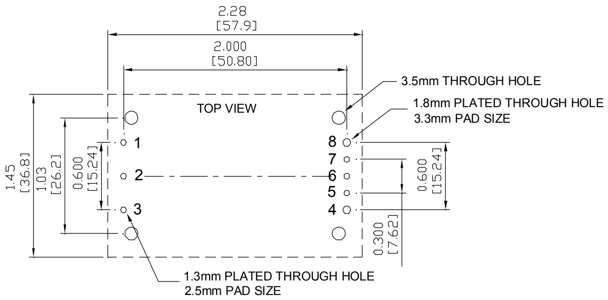
6. Applications

6.1 Recommended Layout, PCB Footprint and Soldering Information

The system designer or end user must ensure that metal and other components in the vicinity of the converter meet the spacing requirements for which the system is approved. Low resistance and inductance PCB layout traces are the norm and should be used where possible. Due consideration must also be given to proper low impedance tracks between power module, input and output grounds. The recommended soldering profile and PCB layout are shown below.



Note：
1. Soldering Materials: Sn/Cu/Ni
2. Ramp up Rate During Preheat: 1.4 ℃/Sec (From 50℃ to 100℃)
3. Soaking Temperature: 0.5 ℃/Sec (From 100℃ to 130℃), 60±20 Seconds
4. Peak Temperature: 260℃, above 250℃ 3~6 Seconds
5. Ramp up Rate During Cooling: -10.0 ℃/Sec (From 260℃ to 150℃)



6.2 Convection Requirements for Cooling

To predict the approximate cooling needed for the Quarter brick module, refer to the power derating curves in section 6.4. These derating curves are approximations of the ambient temperatures and airflows required to keep the power module temperature below its maximum rating. Once the module is assembled in the actual system, the module's temperature should be monitored to ensure it does not exceed 100°C as measured at the center of the top of the case (thus verifying proper cooling).

6.3 Thermal Considerations

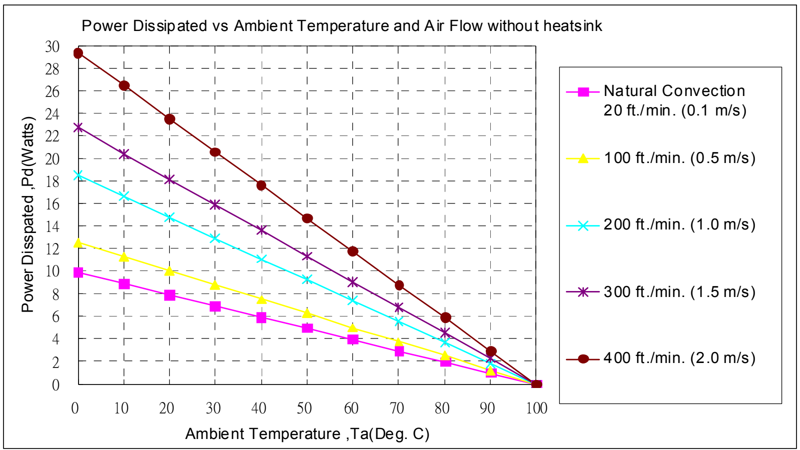
The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. The power output of the module should not be allowed to exceed rated power (V_{o_set} x I_{o_max}).

The power modules have through-threaded,M3 x0.5 mounting holes, which enable heat sinks or cold plates to be attached to the module. Thermal de-rating with heat sinks is expressed by using the overall thermal resistance of the module(R_{ca}).

6.4 Power Derating

The operating case temperature range of CQB75W series is -40℃ to +100℃. When operating the CQB75W series, proper de-rating or cooling is needed. The maximum case temperature under any operating condition should not exceed 100℃.

Forced Convection Power De-rating without Heat Sink



AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection 20ft./min. (0.1m/s)	10.1 ℃/W
100 ft./min. (0.5m/s)	8.0 ℃/W
200 ft./min. (1.0m/s)	5.4 ℃/W
300 ft./min. (1.5m/s)	4.4 ℃/W
400 ft./min. (2.0m/s)	3.4 ℃/W

Example (without heatsink):

What is the minimum airflow necessary for a CQB75W-48S05 operating at nominal line voltage, an output current of 12A, and a maximum ambient temperature of 40℃?

Solution:

Given: Vin=48V_{dc}, Vo=5V_{dc}, Io=12A

Determine Power dissipation (P_d):

$P_d=P_i-P_o=P_o(1-\eta)/\eta$

$P_d=5.0\times12\times(1-0.85)/0.85=10.59$Watts

Determine airflow:

Given: P_d=10.59W and T_a=40℃

Check above Power de-rating curve:

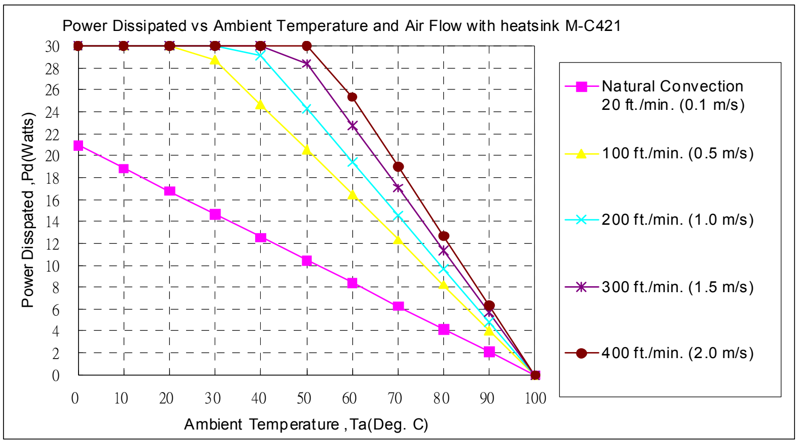
Airflow ≦ 200 ft./min.

Verifying: The maximum temperature rise $\triangle T = P_d \times R_{ca}=10.59\times5.4=57.2$℃

The maximum case temperature $T_c=T_a+\triangle T=97.2$℃ <100℃

Where: The R_{ca} is thermal resistance from case to ambience.

The T_a is ambient temperature and the T_c is case temperature



AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection 20ft./min. (0.1m/s)	4.78 ℃/W
100 ft./min. (0.5m/s)	2.44 ℃/W
200 ft./min. (1.0m/s)	2.06 ℃/W
300 ft./min. (1.5m/s)	1.76 ℃/W
400 ft./min. (2.0m/s)	1.58 ℃/W

Example with heatsink QBT210 (M-C421):
What is the minimum airflow necessary for a CQB75W-24S12 operating at nominal line voltage, an output current of 6.25A, and a maximum ambient temperature of 40℃?
Solution:
Given: Vin=48V_{dc}, Vo=12V_{dc}, Io=6.25A
Determine Power dissipation (P_d):

$P_d=P_i-P_o=P_o(1-η)/η$

$P_d=12×6.25×(1-0.86)/0.86=12.21$Watts

Determine airflow:

Given: P_d=12.21W and T_a=40℃

Check above Power de-rating curve:

P_d<12.55W, Natural Convection

Verify: The maximum temperature rise $△T = P_d × R_{ca}$=12.21×4.78=58.4℃

The maximum case temperature $T_c=T_a+△T$=98.4℃ <100℃

Where: The R_{ca} is thermal resistance from case to ambience.

The T_a is ambient temperature and the T_c is case temperature.

6.5 Quarter Brick Heat Sinks:

6.7 Test Set-Up

The basic test set-up to measure parameters such as efficiency and load regulation is shown below. When testing the modules under any transient conditions please ensure that the transient response of the source is sufficient to power the equipment under test. We can calculate:

- Efficiency
- Load regulation and line regulation.

The value of efficiency is defined as:

$$\eta = \frac{Vo \times Io}{Vin \times Iin} \times 100\%$$

Where:

V_o is output voltage,
I_o is output current,
V_{in} is input voltage,
I_{in} is input current.

The value of load regulation is defined as:

$$Load.reg = \frac{V_{FL} - V_{NL}}{V_{NL}} \times 100\%$$

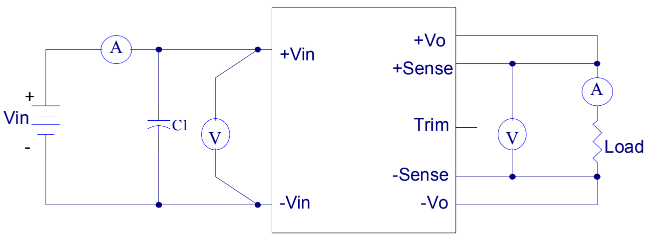
Where:

V_{FL} is the output voltage at full load
V_{NL} is the output voltage at no load

The value of line regulation is defined as:

$$Line.reg = \frac{V_{HL} - V_{LL}}{V_{LL}} \times 100\%$$

Where: V_{HL} is the output voltage of maximum input voltage at full load. V_{LL} is the output voltage of minimum input voltage at full load.



CQB100W Series Test Setup

6.8 Output Voltage Adjustment

In order to trim the voltage up or down one needs to connect the trim resistor either between the trim pin and -Vo for trim-up and between trim pin and +Vo for trim-down. The output voltage trim range is ±10%. This is shown in Figures 1 and 2:

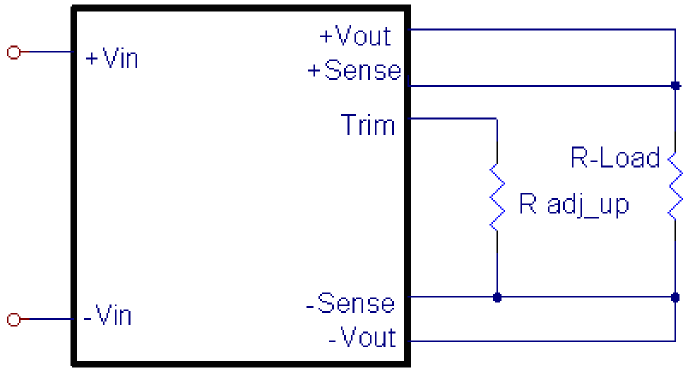


Figure 1. Trim-up Voltage Setup

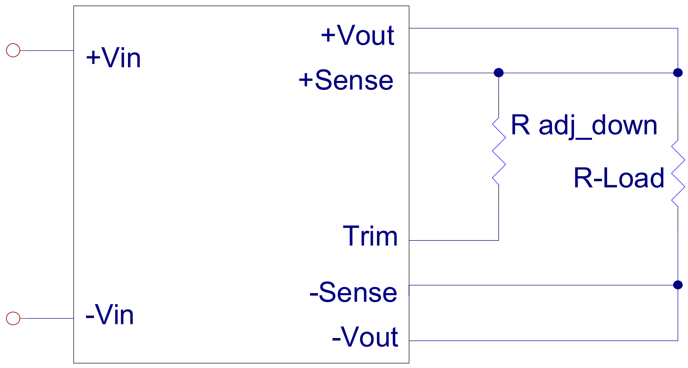

Figure 2. Trim-down Voltage Setup

1. The value of Rtrim_up defined as:

$$R_{trim\_up} = \left(\frac{R_1\left(V_r - V_f\left(\frac{R_2}{R_2 + R_3}\right)\right)}{Vo - V_{o\_nom}} \right) - \frac{R_2 R_3}{R_2 + R_3} \ (\text{K}\Omega)$$

Where: R trim_up is the external resistor in KΩ.

Vo_nom is the nominal output voltage.
Vo is the desired output voltage.
R1, R2, R3 and Vr are internal to the unit and are defined in Table 1.

Output Voltage(V)	R1 (KΩ)	R2 (KΩ)	R3 (KΩ)	Vr (V)	Vf (V)
3.3V	3.0	12	4.3	1.24	0.46
5V	2.32	3.3	0	2.5	0
12V	9.1	51	5.1	2.5	0.46
15V	12	56	8.25	2.5	0.46
24V	20	100	7.5	2.5	0.46

Table 1 – Trim Resistor Values

For example, to trim-up the output voltage of 12V module
(CQB75W-48S12) by 5% to 12.6V, R trim_up is calculated as follows:
Vo – Vo_nom = 12.6 – 12 = 0.6V
R1 = 9.1KΩ, R2 = 51KΩ, R3 = 5.1KΩ, Vr= 2.5V, Vf=0.46

$$R_{trim\_up} = \frac{18.944}{0.6} - 4.636 = 26.94 \ (\text{K}\Omega)$$

2.The value of R trim_down defined as:

$$R_{trim\_down} = \frac{R_1 \times (V_o - V_r)}{V_{o\_nom} - V_o} - R_2 \ \ (K\Omega)$$

Where: R trim_down is the external resistor in Kohm.

Vo_nom is the nominal output voltage.

Vo is the desired output voltage.

R1, R2, R3 and Vr are internal to the unit and are defined in Table 1.

For example, to trim-down the output voltage of 12V module
(CQB75W-48S12) by 5% to 11.4V, R trim-down is calculated as follows:

Vo_nom – Vo = 12 – 11.4 = 0.6V

R1 = 9.1KΩ , R2 = 51KΩ , Vr= 2.5V

$$R_{trim\_down} = \frac{9.1 \times (11.4 - 2.5)}{0.6} - 51 = 83.98 \ \ (K\Omega)$$

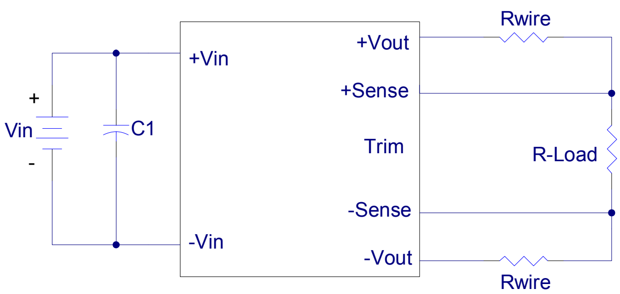
6.9 Output Remote Sensing

The CQB75W series converter has the capability to remotely sense both lines of its output. This feature moves the effective output voltage regulation point from the output of the unit to the point of connection of the remote sense pins. This feature automatically adjusts the real output voltage of the CQB75W series in order to compensate for voltage drops in distribution and maintain a regulated voltage at the point of load. The remote-sense voltage range is:

[(+Vout) - (-Vout)] – [(+Sense) – (-Sense)] ≦ 10% of Vo_nominal

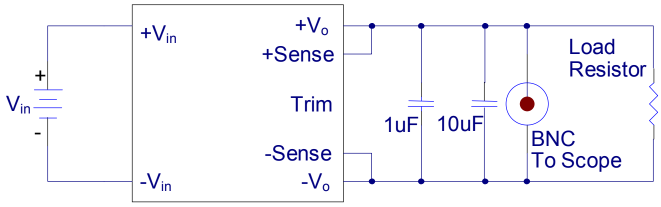
If the remote sense feature is not to be used, the sense pins should be connected locally. The +Sense pin should be connected to the +Vout pin at the module and the -Sense pin should be connected to the -Vout pin at the module.

This is shown in the schematic below.



Note: Although the output voltage can be varied (increased or decreased) by both remote sense and trim, the maximum variation for the output voltage is the larger of the two values not the sum of the values. The output power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. Using remote sense and trim can cause the output voltage to increase and consequently increase the power output of the module if output current remains unchanged. Always ensure that the output power of the module remains at or below the maximum rated power. Also be aware that if $V_{o.set}$ is below nominal value, $P_{out.max}$ will also decrease accordingly because $I_{o.max}$ is an absolute limit. Thus, $P_{out.max} = V_{o.set} \times I_{o.max}$ is also an absolute limit.

6.10 Output Ripple and Noise



Output ripple and noise is measured with 1.0uF ceramic and 10uF solid tantalum capacitors across the output.

6.11 Output Capacitance

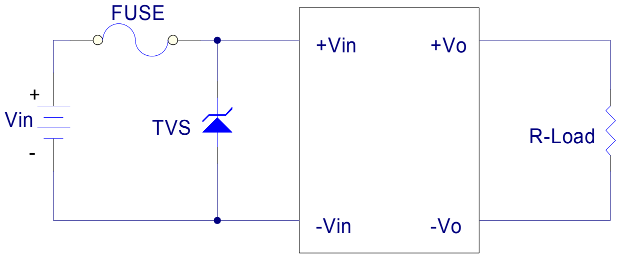
The CQB75W series converters provide unconditional stability with or without external capacitors. For good transient response, low ESR output capacitors should be located close to the point of load. PCB design emphasizes low resistance and inductance tracks in consideration of high current applications. Output capacitors with their associated ESR values have an impact on loop stability and bandwidth. These series converters are designed to work with load capacitanceto see technical specifications

.

7. Safety & EMC

7.1 Input Fusing and Safety Considerations

The CQB75W series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 15A time delay fuse for the 24Vin models and a 8A time delay fuse for the 48Vin models. It is recommended that the circuit have a transient voltage suppressor diode (TVS) across the input terminal to protect the unit against surge or spike voltage and input reverse voltage (as shown).



7.2 EMC Considerations

EMI Test standard: EN55022 Class A and Class B Conducted Emission
Test Condition: Input Voltage: Nominal, Output Load: Full Load

Vin = 48Vdc

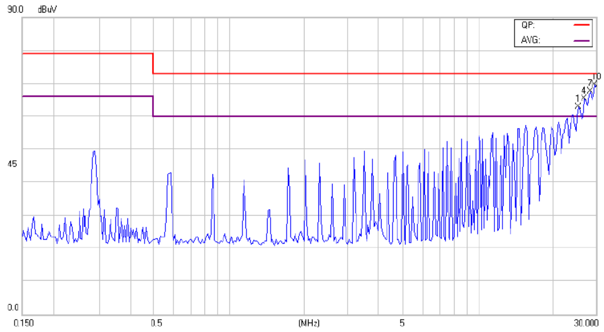
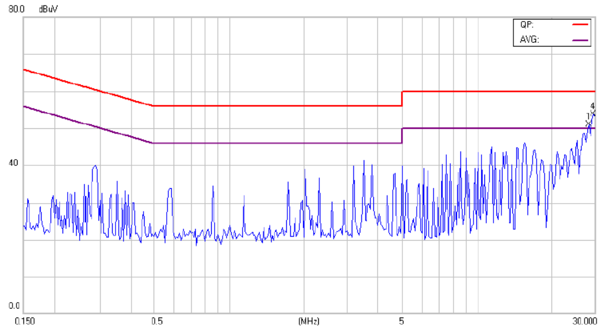
Conducted Class B of CQB75W-48S15

Vin = 48Vdc



Conducted Class A of CQB75W-48S24

Vin = 48Vdc



Conducted Class B of CQB75W-48S24

8. Part Number

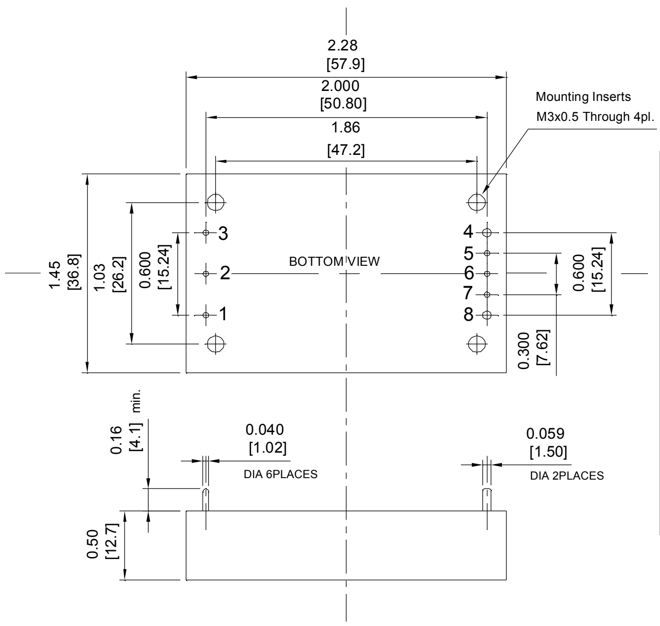
Format: CQB75W - II X OO L

Parameter	Series	Nominal Input Voltage	Number of Outputs	Output Voltage	Remote ON/OFF Logic
Symbol	CQB75W	II	X	OO	L
Value	CQB75W	24: 24 Volts 48: 48 Volts	S: Single	3V3: 3.3 Volts 05: 05 Volts 12: 12 Volts 15: 15 Volts 24: 24 Volts	None: Positive N: Negative

9. Mechanical Specifications

9.1 Mechanical Outline Diagrams

All Dimensions In Inches(mm)
Tolerances Inches: X.XX= ±0.02 , X.XXX= ±0.010
Millimeters: X.X= ±0.5 , X.XX=±0.25



PIN CONNECTION	
Pin	Function
1	+V Input
2	On/Off
3	-V Input
4	-V Output
5	-Sense
6	Trim
7	+Sense
8	+V Output
